

# Unit 8 - Lesson 4

## Selection Sort

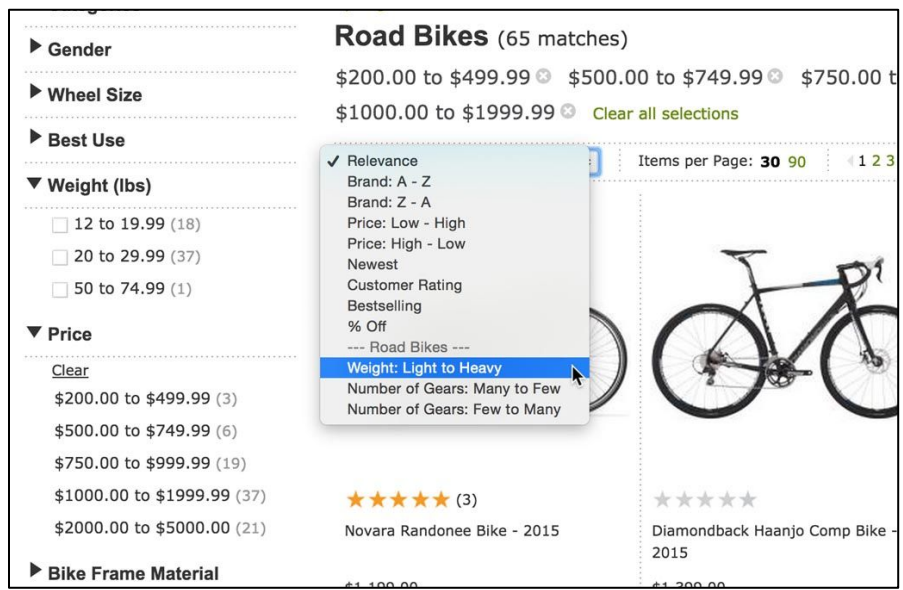

# Discuss:

How do you use the **"Sort By"** feature on an **e-commerce site** like Amazon?

What are some of the **different options** offered to **sort** the products?

The screenshot shows a product listing for "Road Bikes" with 65 matches. The left sidebar contains filter categories: Gender, Wheel Size, Best Use, Weight (lbs), Price, and Bike Frame Material. The Price filter is expanded, showing ranges from \$200.00 to \$5000.00. A dropdown menu is open over the "Sort By" field, listing options such as Relevance, Brand: A-Z, Price: Low-High, and "Weight: Light to Heavy", which is currently selected. The main content area shows two bicycle products with their respective star ratings and prices.

# Lesson Objectives

By the end of this lesson, you will be able to . . .

- Analyze the efficiency of the selection sort algorithm
- Explain the functionality of the selection sort algorithm

## Question of the Day

How can I sort elements in a data structure?

The **selection sort** algorithm selects the **smallest element** from an unsorted array in **each iteration** and places that element at the **beginning** of the unsorted array.

The **selection sort** algorithm selects the **smallest element** from an unsorted array in **each iteration** and places that element at the **beginning** of the unsorted array.

The **selection sort** algorithm selects the **smallest element** from an unsorted array in **each iteration** and places that element at the **beginning** of the unsorted array.

The **selection sort** algorithm selects the **smallest element** from an unsorted array in **each iteration** and places that element at the **beginning** of the unsorted array.

# Selection Sort Algorithm

set min to location 0

search for the smallest value in the list

swap with value at location min

increment min to point to next element

repeat until list is sorted

# ✓ Do This:

Revisit your **Need to Knows!**

- Check off **answered questions** in the **Need to Know** column.
- Add what you have **learned** and **answers to any questions** in the **Learned** column
- Add any **new questions** to the **Need to Know** column

**Step 1: Breaking Down the Project**

**Identify Need to Knows**

Consider what you already know and need to know to complete this project. Use these questions to guide and track your progress throughout the unit and the project. Don't forget to add new questions to your Need to Know list as you learn more!

Know	Need to Know	Learned

5

## Key Vocabulary

- **selection sort:** a sorting algorithm that selects the smallest element from an unsorted array in each iteration and places that element at the beginning of the unsorted array

# Unit 8 - Lesson 5

## Insertion Sort

## **Benchmark #1: Due Lesson 6**

- Brainstorm project ideas and goals
- Decompose the problem to identify the classes and methods you will need to implement
- Obtain and implement feedback from peers

## Do This:

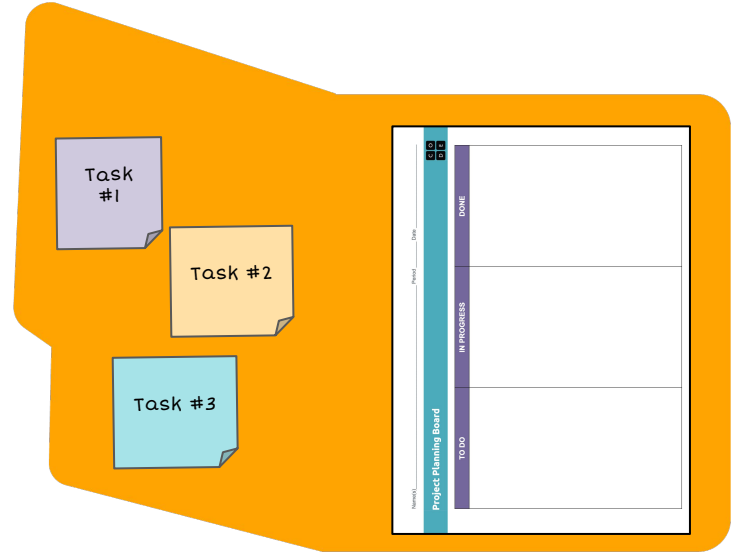

Move the task you will work on to the **IN PROGRESS** column of your Project Planning Board.

Work on your Creative Coding with the Console Project.

 **Do This:**

Update your **Project Planning Board** and **Project Backlog** with any tasks you completed, changed, or added.

# Lesson Objectives

By the end of this lesson, you will be able to . . .

- Compare the efficiency of the insertion sort algorithm with the selection sort algorithm using execution counts
- Explain the functionality of the insertion sort algorithm

## Question of the Day

How does the insertion sort algorithm compare in efficiency with the selection sort algorithm?

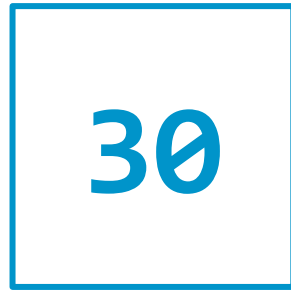

The **insertion sort** algorithm **shifts each item** in a list one at a time to the **correct position** in the sorted portion of the list.

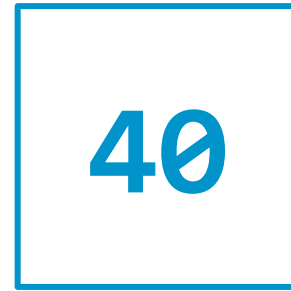

The **insertion sort** algorithm **shifts each item** in a list one at a time to the **correct position** in the sorted portion of the list.

# Insertion Sort Algorithm

loop list from index  $l$  to the end of the list

set current to the value at index

set next to index - 1

while next is greater than or equal to 0 and the value at next is greater than current

set the element at next + 1 to the value at next

decrement next

set the element at next + 1 to current

# Project Planning Feedback

 **You and your partner should have:**

- Project Planning Feedback handout
- pen / pencil

Name(s) \_\_\_\_\_ Period \_\_\_\_\_ Date \_\_\_\_\_

## Activity Guide - Project Planning Feedback

**Feedback Process**

**Step 1:** Partner A presents their project idea. Partner B listens.

**Step 2:** Partner A asks for specific feedback on a certain area of the project (the framing question).

**Step 3:** Partner B gives feedback. Partner A listens and takes notes.

**Step 4:** Open discussion between partners about the suggestions and feedback.

**Step 5:** Partner A thanks Partner B for their feedback. Switch roles to repeat the process.

**Framing Question**

*What can I make better about ...? How can I improve ...?*

1

 **Do This:**

Respond to the prompt on your Project Planning Feedback handout.

Post the tasks for the second benchmark in the **TO DO** column of your Project Planning Board.

The image shows two handouts. The top one is titled "Activity Guide - Project Planning Feedback" and includes a "Feedback Process" section with five steps. The bottom one is titled "Project Planning Board" and features a Kanban-style board with three columns: "TO DO", "IN PROGRESS", and "DONE". The "TO DO" column contains two task cards: "Task #1" (purple) and "Task #2" (orange). The "Project Planning Board" handout is highlighted with a thick orange border.

## Key Vocabulary

- **insertion sort:** a sorting algorithm that shifts each item in a list one at a time to the correct position in the sorted portion of the list

# Unit 8 - Lesson 6

## Merge Sort

## ✓ Do This:

Write an algorithm for **counting loose change.**

$$3 * 25\text{¢} = 75\text{¢}$$

$$7 * 5\text{¢} = 35\text{¢}$$

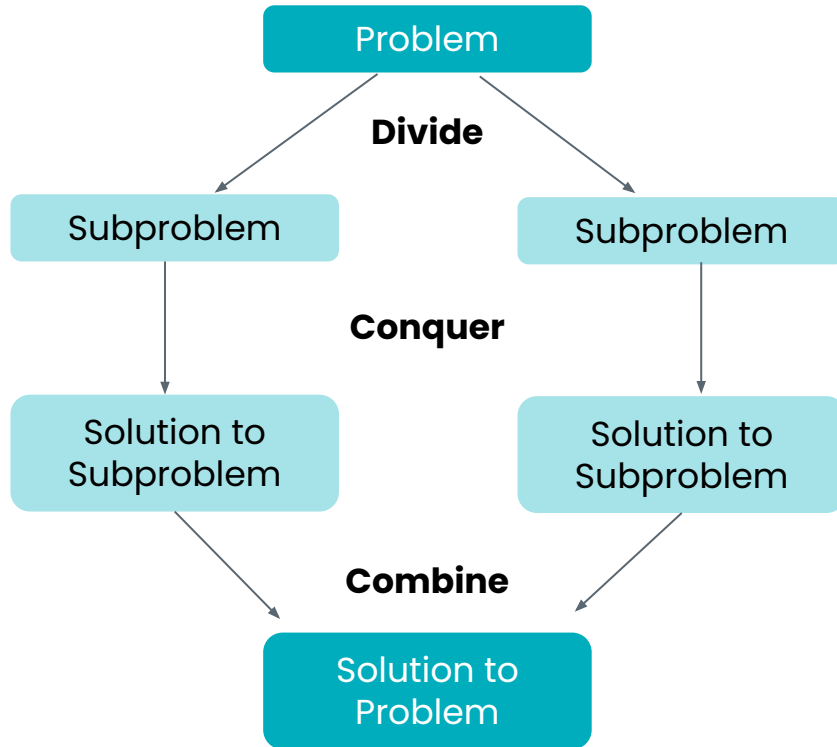

$$2 * 1\text{¢} = 2\text{¢}$$

$$75\text{¢} + 35\text{¢} + 2\text{¢} =$$

**\$1.12**

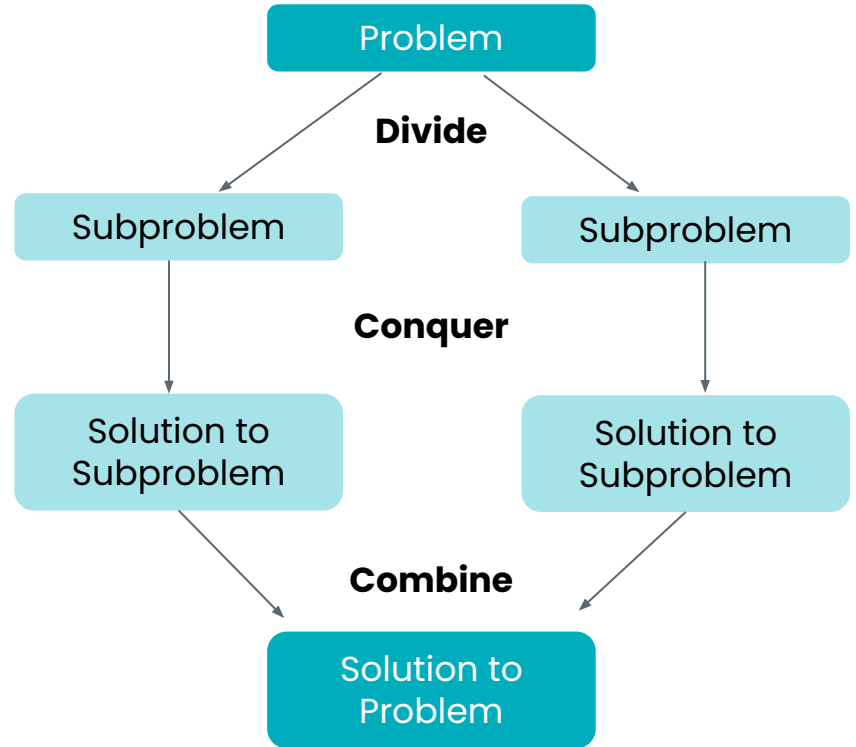

**Divide-and-conquer** is the process of **dividing a problem** into smaller problems, **solving the smaller problems** independently, and then **combining the solutions** to solve the original problem.

# Discuss:

How do you think **sorting algorithms** can use a **divide-and-conquer** approach?

# Lesson Objectives

By the end of this lesson, you will be able to . . .

- Compare the efficiency of the merge sort algorithm with the insertion and selection sort algorithms using execution counts
- Identify the benefits and limitations of the merge sort algorithm

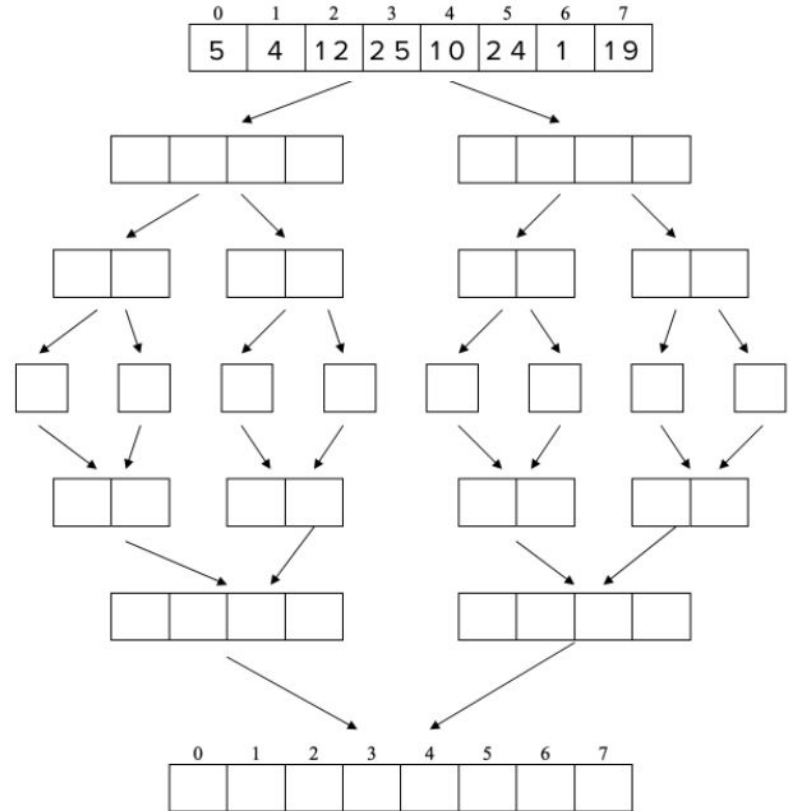

## Question of the Day

How does the merge sort algorithm compare in efficiency with the selection and insertion sort algorithms?

A **merge sort** algorithm repeatedly breaks down a list into **sublists** until each sublist consists of a **single element** and merges those **sorted sublists** until it results into a **sorted list**.

The merge sort algorithm uses a **helper function** to perform part of its task.

```
public static void sort(int[] numList, int left, int right) {  
    if (left < right) {  
        int middle = (left + right) / 2;  
        sort(numList, left, middle);  
        sort(numList, middle + 1, right);  
        merge(numList, left, middle, right);  
    }  
}
```

A **helper function** is a function that performs a component of another function.

## Discuss: What are the **base cases**?

```
public static void sort(int[] numList, int left, int right) {  
    if (left < right) {  
        int middle = (left + right) / 2;  
        sort(numList, left, middle);  
        sort(numList, middle + 1, right);  
        merge(numList, left, middle, right);  
    }  
}
```

## Discuss: What is the **recursive call**?

```
public static void sort(int[] numList, int left, int right) {  
    if (left < right) {  
        int middle = (left + right) / 2;  
        sort(numList, left, middle);  
        sort(numList, middle + 1, right);  
        merge(numList, left, middle, right);  
    }  
}
```

# Do This:

Revisit your **Need to Knows!**

- Check off **answered questions** in the **Need to Know** column.
- Add what you have **learned** and **answers to any questions** in the **Learned** column
- Add any **new questions** to the **Need to Know** column

**Step 1: Breaking Down the Project**

**Identify Need to Knows**

Consider what you already know and need to know to complete this project. Use these questions to guide and track your progress throughout the unit and the project. Don't forget to add new questions to your Need to Know list as you learn more!
